MAC Recap – MVP PRD (v1)

Oct 7, 2026 · @Sonja

1. Goals and context

MAC Recap is an internal tool that automates the creation of case studies at project close. It does not generate content from scratch: it assembles, organizes and structures existing, already verified material.

Goals:

- Reduce the time to generate a case study to **15-20 minutes**
- Validate the tool at **8 weeks** and measure its business impact at **6 months**
- Release the MVP, developed independently of MAC Productive, by **October 31**
- Start the integration with MAC Productive from **November 2**

2. User roles

Role	What they do in the tool
Owner	Uploads project material, assigns tags, properties and flags, reviews and approves the case study
Designer	Manages templates, reviews and approves the case study
Admin	Manages users and permissions, with no access to guardrails
Account / sales	Requests case studies, downloads and publishes them; does not create them

3. Functional requirements

MVP (by October 31)

- **FR1** – The system creates every case study with a **unique ID**, ready to be linked to the project order
- **FR2** – The owner uploads files and text and assigns tags, properties and flags to deliverables

- **FR3** – The system generates graphic case studies by applying templates to the uploaded material
- **FR4** – Templates adapt to the number of available media items
- **FR5** – Owner and designer review and edit case studies through the configurator and review dashboard
- **FR6** – Approval makes the case study available as an **Approved case**
- **FR7** – The system allows exporting the final material and publishing the case study
- **FR8** – Owner, designer and admin sign in through a login, with distinct roles and permissions

Backlog (from November 2)

- **FR9** – The tool connects to MAC Productive via MCP
- **FR10** – The system generates text-based case studies and whitepapers from project order data

4. Non-functional requirements and guardrails

Guardrails are non-negotiable constraints: any requirement that contradicts them must be flagged, not implemented.

- **NFR1** – The AI does not alter graphic assets, the technical substance of the content, or template design
- **NFR2** – Generated technical content is checked to prevent hallucinations
- **NFR3** – No role can configure the guardrails, admin included
- **NFR4** – Generating a case study takes **15-20 minutes** at most
- **NFR5** – Texts follow the defined narrative structure (challenge, approach, result) and the quality checklist

5. Technical assumptions

- Dedicated database on **Supabase**, file storage on an **AWS S3 bucket**
- Development with **Claude Code** and the **BMAD** method
- Tool kept separate from MAC Productive: the connection will run via **MCP** using the case study's unique ID
- Development epics run **one after another**, in epic order, never in parallel
- Login, users and permissions arrive at the end of the MVP: until then the tool runs without authentication in a development environment

6. Release plan by sprint

The order follows the development plan. Non-dev activities are prerequisites for the epics in the same sprint or the next one.

Sprint	Due	Development	Non-dev activities
Sprint 1	October 14	Epic 1 – Setup with BMAD; Epic 2 – Asset upload and tagging	Tool design definition; Template wireframes; Data processing logic
Sprint 2	October 21	Epic 3 – Graphic case study generation; Epic 4 – Review and approval; Epic 5 – Download and publishing	Configurator visual design (Bento); Account/sales user journey; Final case study templates; Narrative structure and quality criteria
Sprint 3	October 28	Epic 6 – Login, users and permissions	Mockups and assets for case studies; Guardrail check; Pilot test and onboarding; Presentation (October 30)
Backlog	from November 2	Epic 7 – MAC Productive integration; Epic 8 – Text-based case study generation	Mockup and asset guidelines

7. Epic list

1. **Epic 1 – Setup with BMAD**: configure Claude Code with the BMAD method as the project foundation
2. **Epic 2 – Asset upload and tagging**: create the case study with a unique ID and handle file and text upload with tags, properties and flags
3. **Epic 3 – Graphic case study generation**: generate case studies by applying graphic templates to the uploaded material
4. **Epic 4 – Review and approval**: review, edit and approve case studies through the configurator and dashboard
5. **Epic 5 – Download and publishing**: export the final material and publish the approved case study
6. **Epic 6 – Login, users and permissions**: introduce authentication and role-based permissions
7. **Epic 7 – MAC Productive integration** *(backlog)*: connect the tool to the project management system via MCP

8. **Epic 8 – Text-based case study generation** *(backlog)*: generate text-based case studies and whitepapers from project order data

8. Epic details

Epic 1 – Setup with BMAD *(Sprint 1)*

Story 1.1 – As the team, I want to configure Claude Code with the BMAD method.

- The project is initialized with BMAD
- The PRD is available as input for the following phases

Epic 2 – Asset upload and tagging *(Sprint 1)*

Prerequisites: tool design definition, template wireframes (asset dimensions, formats).

Story 2.1 – As the team, I want a Supabase database and AWS S3 storage to save case studies and assets.

- Case study data is stored on Supabase
- Uploaded files are stored on AWS S3

Story 2.2 – As an owner, I want to create a case study with a unique ID.

- Every case study receives a unique ID on creation
- The ID is ready for the future link to the project order

Story 2.3 – As an owner, I want to upload files and text to the case study.

- The file and text upload flow is complete
- Uploaded material is associated with the case study

Story 2.4 – As an owner, I want to assign tags, properties and flags to deliverables.

- Tags, properties and flags are saved for each deliverable

Epic 3 – Graphic case study generation *(Sprint 2)*

Prerequisites: graphic template layouts, final case study templates, narrative structure and quality criteria, data processing logic.

Story 3.1 – As an owner, I want to generate a case study by applying graphic templates to the uploaded material.

- The case study is generated from the graphic templates
- Graphic assets and template design remain unchanged
- Texts follow the challenge, approach, result structure

Story 3.2 – As an owner, I want the template to adapt to the number of available media items.

- The adaptation rules defined in the final template are applied

Epic 4 – Review and approval *(Sprint 2)*

Prerequisite: configurator visual design (Bento).

Story 4.1 – As an owner or designer, I want a review dashboard for generated case studies.

- The dashboard shows case studies awaiting review

Story 4.2 – As an owner or designer, I want to edit a case study through the configurator.

- The configurator follows the designed Bento layout

Story 4.3 – As an owner or designer, I want to approve a case study.

- The approved case study moves to the **Approved case** status and becomes available for download

Epic 5 – Download and publishing *(Sprint 2)*

Prerequisite: account/sales user journey.

Story 5.1 – As an account, I want to export the final material of an approved case study.

- Only approved case studies can be exported

Story 5.2 – As an account, I want to publish the case study.

- The approved case study can be published

Epic 6 – Login, users and permissions *(Sprint 3)*

Story 6.1 – As an owner, designer or admin, I want to sign in through a login.

- There is a login panel for each of the three roles

Story 6.2 – As an admin, I want to manage roles and permissions.

- Owner: upload and review
- Designer: templates and approval
- Admin: users and permissions

Story 6.3 – As the team, I want no role to have access to the guardrails.

- Not even the admin can view or edit the guardrails

MVP closing activities *(Sprint 3, non-dev)*

- **Guardrail check**: verify that the AI does not alter graphic assets, technical substance or template design; check for hallucinations in technical content
- **Pilot test and onboarding**: trial with the creative director, sales and other roles involved; collect feedback for the next development steps
- **Presentation** of the results on **October 30**

9. Backlog (from November 2)

Epic 7 – MAC Productive integration

Story 7.1 – As the team, I want to connect the tool to MAC Productive via MCP.

- Case study and project order are linked through the unique ID

Story 7.2 – As the team, I want to verify the data and formats coming from Lovable.

- Data received from MAC Productive is compatible with the tool's data model

Epic 8 – Text-based case study generation

Story 8.1 – As an owner, I want to build the narrative from the project order data uploaded to the tool.

Story 8.2 – As an owner, I want to generate mainly text-based case studies for projects without visual material.

Story 8.3 – As an account, I want to generate text-based case studies in whitepaper format.

Non-dev activities

- **Mockup and asset guidelines**: decide how to standardize the assets to include in case studies

10. Open points

These points are not yet defined in the development plan and must be resolved before the epics that depend on them.

1. **Output formats**: which output formats to produce in the templates (Epic 3)
2. **Data processing logic**: how the tool turns uploaded data into content (Epic 3)
3. **Tag, property and flag taxonomy**: list and meaning of the values that can be assigned to deliverables (Epic 2)

4. **Account/sales user journey**: how accounts reach approved case studies before the MAC Productive integration (Epic 5)
5. **Export and publishing**: export formats and publishing channels (Epic 5)
6. **Test or real data**: which data to use until login is active (Epics 2-5)
7. **Data exposure from MAC Productive**: data structure via MCP and client data confidentiality requirements (Epic 7)
